

BSV ASSOCIATION

A trustless token curve on the BSV Blockchain

Buy and sell against an on-chain
reserve — no custody, no forgeable
token

BSV Association

July 2026

1 UTXO

THE WHOLE POOL LIVES ON-CHAIN

Two-way

BUY AND SELL ON THE CURVE

Drain-proof

NO OPERATOR KEY, NO INDEXER

STAS

REAL TOKENS AT GRADUATION

A **bonding curve** is an automated market maker: a single on-chain pool that quotes its own price. The more tokens sold, the higher the price; sell back and the price falls. Buyers pay sats into the pool's reserve and receive a balance; sellers return their balance for sats. Everything — the reserve, the price rule and every holder's balance — lives inside one covenant UTXO on the BSV Blockchain.

It is **non-custodial and operator-free**: the platform never holds keys or funds and never quotes a price. Buyers fund their own trades; sellers sign their own withdrawals; the covenant enforces the price. When the curve completes, the pool **graduates** — minting real, wallet-held STAS tokens to every holder and settling the reserve.

— The lifecycle

Buy along the curve

- Pay sats — the price rises as supply sells.
- Your balance is credited inside the pool's ledger.

Sell back anytime

- Sign to authorise — the pool pays you the refund.
- Price falls back down the same curve.

Price set on-chain

- A fixed formula in the covenant, not an operator quote.
- Every trade re-prices the pool automatically.

Graduate to STAS

- On completion, holders receive real STAS tokens.
- The reserve is settled and the token trades freely.

— Stage by stage

STAGE	WHAT HAPPENS ON-CHAIN
Deploy	Owner seeds the reserve; the pool covenant goes live
Buy	Sats into the reserve; your key is credited in the ledger
Sell	You sign; the covenant debits you and pays the refund
Reserve	Grows on buys, shrinks on sells — always one UTXO
Ownership	A ledger entry, proven by your signature
Verify	Anyone replays the pool's tx history to check it
Graduation	Curve completes → mint STAS to holders + settle reserve

Buy, sell, and graduate — a two-way market with the reserve locked on-chain, no custodian, and no token anyone can forge.

Thank you
